Playbook Wealth

How our Doc AI onboarding works

A plain-language tour for Brady, Tier 1 onboarding platform

THE PROBLEM

Client documents get typed in by hand

Re-keying

Every tax return, statement or estate document means copying values into forms and systems, one field at a time.

Slow and error-prone

A transposed digit on a contribution-room figure is easy to make and hard to spot later.

Repeated per client

The same documents arrive for every onboarding, so the same typing happens again and again.

Goal: let the software read the document, and let the advisor check the result instead of typing it.

THE FLOW

From upload to committed values

1
Upload
Client adds a PDF or photo of the document

→

2
Classify
Claude names the document type

→

3
Extract
Claude pulls out structured fields

→

4
Store
File is saved in the client vault

→

5
Review
Advisor compares extracted and current values

→

6
Commit
Advisor approves; values are written

The review screen shows each value side by side with what we hold today, plus a **confidence** rating and a **mismatch** flag. Accepts PDF, JPG, PNG and WEBP.

WHAT IT READS TODAY

Five document families

- **T1 General** (personal tax return)
- **Notices of Assessment**
- **Account statements**
- **Estate documents** (wills, powers of attorney, beneficiary designations, trusts)
- **Competitor financial plans**

SEPARATE SCRIPTS

Statement ingestion

Designed Securities statements and Broadridge snapshots, read into holdings. These run on their own, outside the upload flow.

HUMAN IN THE LOOP

Nothing is written without advisor review

Identity **Income** **RRSP** **TFSA** **Tax**

Field	Extracted	Current	Flag
Taxpayer name	Jane Sample	Jane Sample	Match, high confidence
Total income	$11,111	$22,222	Mismatch, high confidence
RRSP room	$33,333	(empty)	New, low confidence

Dummy data for illustration only.

RELATED PIECES

Two neighbours worth knowing

GroupRSP KYC flow

Member proposes a change → **Advisor approves** → **E-sign step**

The e-sign step is a stub, and everything runs on demo data only.

Onboarding checklist tracker

A tracker for the steps of a client onboarding, so everyone can see what is done and what is outstanding.

WHAT IS NEXT

The gap: nothing fills PDF forms yet

The system reads documents and stores reviewed values, but no one fills a PDF form from them automatically. A KYC update-form pre-fill is planned.

GROUND RULES

Two rules before we build

Code and schemas only

Work with dummy data. No real client documents are shared or used for testing.

Extraction sends documents to Anthropic

Vendor and client-consent coverage is confirmed before any real documents go through.
